Deodorant Roll-on production

THE APPLICATION SCOPE / PURPOSE

Deodorant is usually applied to the armpits to avoid unpleasant odor. The aim is to cover the odour by means of fragrances, to control the formation of microorganisms by means of antimicrobial substances and, to some extent, to influence the activity of the sweat glands by antiperspirants such as aluminium chlorohydrate. Deo-rollers are usually based on a gel former, emulsifiers, ethanol, wax and fragrances (and possibly aluminium chlorohydrate). A controlled and efficient dispersion under pH and temperature control for the explosion zone is required and is offered by Kinematica.
